

Name _____

Global Warming

Global warming refers to the increase in the Earth's temperature, which then causes changes in the climate. Global warming is caused by human activities such as the release of carbon dioxide and other air pollution into the atmosphere, which then collects in the atmosphere like a blanket, blocking out the sun's heat, therefore causing the planet to warm up. The gases released into the atmosphere are referred to as the greenhouse gases.

There are many ways you can reduce global warming pollution such as using renewable energy like a wind generated farm, instead of burning up more limited fossil fuels such as coal for electricity.

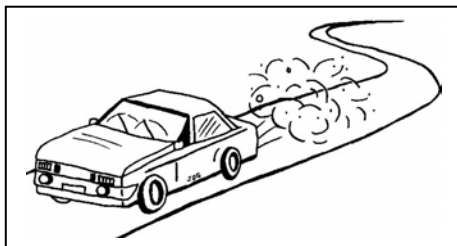

Write down 3 more ways on how to reduce greenhouse pollution:

- 1) _____

- 2) _____

- 3) _____

Draw 3 more pictures of something that produce greenhouse gases, write down the type of pollutions emitted.

Cars emit carbon monoxide.
